<b>Indicator type:</b>	Indicator
<b>Short name:</b>	PI 03-Hospitalisation rates by principal diagnosis, 2011
<b>METEOR identifier:</b>	425741
<b>Registration status:</b>	<a href="#">Indigenous</a> , Superseded 01/07/2012
<b>Description:</b>	Hospital separation rates for leading principal diagnoses for Australians, by Indigenous status.
<b>Rationale:</b>	Monitoring hospitalisation rates for different diseases so that it is understood which diseases are major contributors to morbidity among Indigenous Australians and where programs are succeeding and where they are not will assist in achieving the closing the gap targets.

**Comments:**

Most recent data available for 2011 CRC report is 2008-09.

National disaggregation by Indigenous status will be based on data only from jurisdictions for which the quality of Indigenous identification is considered acceptable.

At this stage, only data from selected state/territories are considered of acceptable quality for reporting hospitalisations of Indigenous persons: NSW, Vic, Qld, WA, SA & NT public hospitals. Tas/ACT data should be reported with caveats. National rates should include these six states and territories only.

Rates are directly age standardised to the 2001 Australian ERP.

National estimates adjusted for under-identification will be reported for leading principal diagnoses.

Disaggregation by Indigenous status is to be reported using 2 years combined data for the current reporting period. Single year data is to be reported for time series.

Baseline year for this indicator is 2006; target year is 2031.
