Acute coronary syndromes: 2b-ECG performed within 10 minutes of arrival of ambulance

Identifying and definitional attributes

Metadata item type: Indicator Indicator type: Indicator

Short name: Indicator 2b-ECG performed within 10 minutes of arrival of ambulance

METEOR identifier: 612032

Registration status: Health, Standard 12/09/2016

Description: Proportion of patients with chest pain with a 12-lead electrocardiogram (ECG)

performed within 10 minutes of first clinical contact, after arrival of ambulance.

Rationale: Early diagnosis optimises door-to-needle time and time to other interventions. The

time taken to record the first ECG is a good index of quality care. The European Society of Cardiology guidelines identify that ECG should be performed within ten minutes or less after the first clinical contact (either on arrival of the patient in the emergency department or at first contact with emergency medical services in the pre-hospital setting) and immediately interpreted by a qualified physician (Steg et

al. 2012; Hamm et al. 2011).

Indicator set: Clinical care standard indicators: acute coronary syndromes

Health, Standard 12/09/2016

Outcome area: Early assessment

Health, Standard 12/09/2016

Collection and usage attributes

Computation description: 'First clinical contact' is defined as the time that emergency medical services

personnel arrive at the patient (Fosbol et al. 2013).

Presented as a percentage.

Computation: (Numerator ÷ denominator) x 100

Numerator: Number of patients with chest pain who receive a 12-lead ECG within 10 minutes

of first clinical contact, after arrival of ambulance.

Denominator: Number of patients with chest pain attended to by ambulance.

Representational attributes

Representation class: Percentage

Data type: Real

Unit of measure: Service event

Format: N[NN]
