KPIs for Australian Public Mental Health Services: Pl 08 – Population access to specialised clinical mental health care, 2018 (Service level)

Identifying and definitional attributes

Metadata item type: Indicator Indicator type: Indicator

Short name: MHS PI 08: Population access to specialised clinical mental health care, 2018

(Service level)

METEOR identifier: 630413

Registration status: Health, Superseded 13/01/2021

Description: The percentage of consumers who reside in the mental health service

organisation's defined catchment area who received care from a public sector

mental health service (including inpatient, ambulatory and residential).

NOTE: This indicator is related to *Population access to specialised clinical mental health care (Jurisdictional level)*. There are no technical differences in the calculation methodologies between the Service level version and the Jurisdictional

level version of this indicator.

Rationale: The issue of unmet need has become prominent since the National Survey of

Mental Health and Wellbeing (ABS 2008) indicated that a majority of people

affected by a mental disorder do not receive treatment.

The implication for performance indicators is that a measure is required to monitor population treatment rates and assess these against what is known about the

distribution of mental disorders in the community.

Access issues figure prominently in concerns expressed by consumers and carers about the mental health care they receive. More recently, these concerns have been

echoed in the wider community.

Most jurisdictions have organised their mental health services to serve defined catchment populations, allowing comparisons of relative population coverage to be

made between organisations.

Indicator set: Key Performance Indicators for Australian Public Mental Health Services (Service

level version) (2018)

Health, Superseded 13/01/2021

Collection and usage attributes

Computation description: Coverage/Scope:

All public mental health service organisations.

Mental health consumers for which a unique person identifier was not recorded, that

is non-uniquely identifiable consumers are excluded.

Methodology:

• Requires a non-duplicated consumer count across all settings.

 Statistical local area codes or postcodes recorded at the time of community contact need to be mapped to mental health service organisation catchment population boundaries.

Computation: (Numerator ÷ Denominator) x 100

Numerator: Number of consumers who reside in the defined catchment area who received

services from the mental health service organisation's specialised mental health

services within the reference period.

Denominator: Number of mental health consumers who reside in the mental health service

organisation's defined catchment area within the reference period.

Disaggregation: Service variables: nil.

Consumer attributes: age, Socio-Economic Indexes for Areas (SEIFA),

remoteness, Indigenous status.

Representational attributes

Representation class: Percentage

Data type: Real Unit of measure: Person Format: N[NN].N

Indicator conceptual framework

Framework and

dimensions:

Accessible

Accountability attributes

Benchmark: Levels at which the indicator can be useful for benchmarking:

- · mental health service organisation
- regional group of services
- state/territory.

collection required:

Further data development / This indicator cannot be accurately constructed using the mental health National Minimum Data Sets (NMDSs) because the data sets do not include unique patient identifiers that allow linkage across data sets.

> A proxy solution is to use only the Community Mental Health Care NMDS, which is estimated to include more than 90% of all persons by public mental health services. The accuracy of this solution is limited by the fact that states and territories vary in the extent to which unique patient identifiers are available on a state-wide basis.

> Accurate construction of this indicator at a national level requires separate indicator data to be provided individually by states and territories.

> Development of state-wide unique patient identifiers within all mental health-related NMDSs is needed to improve this capacity.

Other issues caveats:

- As defined populations may receive services from organisations other than
 their catchment provider, this measure is not a 'pure' indicator of mental
 health service organisation performance but more about service utilisation by
 the population they serve. However, it is regarded as an important indicator to
 understand the overall relationship of the mental health service organisation in
 relation to its catchment population needs.
- Resource allocation based on psychiatric epidemiology, associated
 morbidity and disability, mortality and socio-demographic factors is generally
 regarded as resulting in a more equitable distribution of resources in relation
 to local need than funding strategies based on service-utilisation and
 population size alone. This indicator advances these concepts by creating
 scope in the future to compare expected treatment rates to actuals.
- This measure does not consider the roles of primary mental health care or the specialist private mental health sector. While people who received care from specialist non-government organisations are not counted, it is expected that the majority of these people will be captured by the activities of clinical services.
- This measure may under-report levels of service access in areas where persons are able to access public sector mental health services across jurisdictional boundaries.
