Palliative care phase

Identifying and definitional attributes

Metadata item type: Glossary Item

METEOR identifier: 647046

Registration status: Independent Hospital Pricing Authority, Standard 03/11/2016

Definition: The palliative care phase refers to a distinct clinical period which reflects the stage

of the patient's illness. Palliative care phase provides a good indication of the type

of care required by a palliative care patient.

An episode of admitted patient palliative care may comprise of a single phase or multiple phases, depending on changes in the patient's condition. Phases are not sequential and a patient may move back and forth between phases within the one

episode of admitted patient palliative care.

The palliative care phases are stable, unstable, deteriorating, terminal and

bereavement.

Context: Palliative care phase is a common assessment measure recorded for episodes of

admitted patient palliative care. Palliative care is care in which the clinical intent or treatment goal is primarily quality of life for a patient with an active, progressive

disease with little or no prospect of cure. It is usually evidenced by an

interdisciplinary assessment and/or management of the physical, psychological, emotional and spiritual needs of the patient; and a grief and bereavement support

service for the patient and their carers/family.
