# KPls for Australian Public Mental Health Services: PI 02J - Mental health readmissions to hospital, 2018 

Identifying and definitional attributes
Metadata item type: Indicator
Indicator type: Indicator

## Short name:

METEOR identifier:
Registration status:
Description:

| Rationale: | Readmissions to an acute admitted patient mental health care service unit following <br> a recent discharge may indicate that inpatient treatment was incomplete or <br> ineffective, or that follow-up care was inadequate to maintain the person's <br> treatment out of hospital. In this sense, rapid readmissions may point to |
| :--- | :--- |
| deficiencies in the functioning of the overall care system. |  |

Collection and usage attributes

State/territory public acute admitted patient mental health care service units.
The following readmissions are excluded when calculating the numerator:

- same-day separations
- separations where the length of stay is one night only and a procedure code for Electroconvulsive therapy (ECT) is recorded.

The following separations are excluded when calculating the denominator:

- same-day separations
- separations where the length of stay is one night only and a procedure code for Electroconvulsive therapy (ECT) is recorded.
- statistical and change of care type separations
- separations that end in death or left against medical advice/discharge at own risk
- separations that end by transfer to another acute or psychiatric hospital.

## Methodology:

- Reference period for 2018 performance reporting: 2016-17. Readmissions where the initial separation occurred within the reference period are in scope.
- Readmission is considered to have occurred if the person is admitted to any public acute admitted patient mental health care service unit within the state/territory. Consequently, a state-wide unique patient identifier is required for accurate construction of this indicator.
- Readmissions where the person is separated and readmitted on the same day are included.
- For the purpose of this indicator, when a mental health service organisation has more than one unit of a particular admitted patient care program, those units should be combined.
- The categorisation of the admitted patient mental health care service unit is based on the principal purpose(s) of the admitted patient care program rather than the care type of the individual consumers.
- The following Australian Classification of Health Interventions (ACHI) ECT procedure codes are relevant for the excluded separations specified above:
* ACHI 5th edition use procedure codes 93340-02 and 93340-03.
* ACHI 6th to 9th editions use procedure codes 93341-00 to 93341-99.
* ACHI 10th edition use procedure codes 14224-00 to 14224-06.
* ACHI 5th to 10th editions ECT Block 1907 may be selected to capture all data regardless of code changes over time.
- No distinction is made between planned and unplanned readmissions.

Computation:
Numerator:
(Numerator $\div$ Denominator) $\times 100$
Number of readmissions to a state/territory public acute admitted patient mental health care service unit(s) occurring within the reference period.

## Numerator data elements:

## Data Element / Data Set

## Data Element

Number of readmissions to a public acute admitted patient mental health care service unit within 28 days

## Data Source

State/territory admitted patient data

## Guide for use

Determining whether there was a readmission for in-scope separations for the numerator requires data for the 28 days of the next financial year to be included in determining whether a readmission has occurred.

Denominator:

Number of in-scope overnight separations from state/territory acute admitted patient mental health care service unit(s) occurring within the reference period.

Denominator data elements:

## Disaggregation:

Data Element / Data Set

## Data Element

Number of separations from public acute admitted patient mental health care service unit(s)

## Data Source

State/territory admitted patient data
Guide for use
In-scope separations for the denominator are identified prior to determining whether a readmission has occurred. The total number of in-scope separations is expected to comprise separations for the full 12 months of the data set year

Consumer attributes: age, sex, Socio-Economic Indexes for Areas (SEIFA), remoteness, Indigenous status. Disaggregated data excludes missing or not reported data.

All disaggregated data are to be calculated as at the admission for the first index separation, even if the value is null. The index separation refers to the separation data point included in the denominator data set. The data at admission for the index separation should be used for the associated numerator data pair, when present, and any subsequent denominator and data pairs for a uniquely identifiable person.

Disaggregation data elements:

## Data Element / Data Set

## Representational attributes

| Representation class: | Percentage |
| :--- | :--- |
| Data type: | Real |
| Unit of measure: | Service event |
| Format: | N[NN].N |
| Indicator conceptual | framework |

## Framework and Effective dimensions: <br> Continuous

## Accountability attributes

Reporting requirements: State/territory supplied data.
Benchmark: State/territory level
Further data development / This indicator cannot be accurately constructed using the Admitted Patient Care collection required:

## Other issues caveats:

Due to data limitations this indicator cannot differentiate between planned and unplanned readmissions. This indicator does not track readmissions across state and territory boundaries or track movement between public and private hospitals.

## Source and reference attributes
