# Indigenous-specific primary health care: PI20a- Number of Indigenous regular clients who have the necessary risk factors recorded to assess absolute cardiovascular disease (CVD) risk, December 2020

## Identifying and definitional attributes

<b>Metadata item type:</b>	Indicator
<b>Indicator type:</b>	Output measure
<b>Short name:</b>	PI20a-Number of Indigenous regular clients who have the necessary risk factors recorded to assess absolute cardiovascular disease (CVD) risk, December 2020
<b>METEOR identifier:</b>	739463
<b>Registration status:</b>	<a href="#">Indigenous</a> , Superseded 03/07/2022
<b>Description:</b>	Number of <a href="#">Indigenous regular clients</a> with no known cardiovascular disease (CVD), aged 35 to 74, who had information available to calculate their absolute CVD risk.
<b>Rationale:</b>	Assessment of absolute CVD risk based on multiple risk factors is more accurate than that based on individual risk factors due to the cumulative nature of risk effects. In view of this additive predictive power, basing management decisions using this approach should improve CVD outcomes.
<b>Indicator set:</b>	<a href="#">Indigenous-specific primary health care national key performance indicators December 2020</a> <a href="#">Indigenous</a> , Superseded 03/07/2022
