

Classification scheme

The following information is applicable to value domains only.

Definition

The name of the classification scheme which is implemented in this value domain.

Obligation

Conditional completion: complete for all value domains which are of representation class Code and implement a full chapter of, or entire classification scheme.

Development rules

State the full and formal title of the classification scheme. If an incomplete set of values from a classification is implemented by a value domain, or no classification is associated with the value domain, leave this field blank.

A value domain may implement only one classification scheme.

To add a classification scheme

1. Click the *Add...* button. This will open the *Classification scheme browser* window.
2. You are able to view all the classification schemes within METEOR in an alphabetic list.
3. Scroll through the list to find the relevant classification scheme and then select *OK*.
4. Your selected classification scheme will now be listed in the create new value domain window.
5. To remove the selected classification scheme, click the *Remove* button.

If the correct classification scheme for your value domain doesn't already exist in METEOR, you can create a new one by clicking the *Create...* button in the Classification scheme browser window or from your Workgroup page.
