

Current registration status

Registration status is the value assigned to a metadata item as it progresses through the registration process. This table lists the current registration status and the corresponding registration authority for the metadata item.

The Registration statuses used in METeOR are:

- Proposed - A developer has proposed this item for consideration by the registrar and subsequently by a Registration authority.
- Recorded - The registrar has determined that the item meets quality criteria and can proceed for consideration by a nominated data committee.
- Candidate - The item has been considered by a data committee and has accepted onto their work program.
- Standardisation pending - A data committee has recommended the item to a Registration authority for approval as a Standard.
- Standard - The item has been accepted by a Registration authority as a standard.
- Superseded - The item has been nominated by a Registration authority as superseded.
- Retired - The item has been nominated by a Registration authority as retired.
- Not progressed - The item will no longer be considered by the registrar, a data committee or a Registration authority.

An item without a registration state indicates that it has not yet been submitted to a registrar.
