Postal delivery point identifier {N(8)}

Exported from METEOR (AIHW's Metadata Online Registry)

Postal delivery point identifier {N(8)}

Identifying and definitional attributes

Metadata item type:	Value Domain
METEOR identifier:	270905
Registration status:	Community Services (retired), Superseded 25/08/2005 Health, Superseded 04/05/2005
Definition:	A logical combination of valid numeric characters that identify Postal Delivery Point Identifier (PDPID) code or blank.

Representational attributes

Representation class:	Identifier
Data type:	Number
Format:	{N(8)}
Maximum character length:	8

Collection and usage attributes

Guide for use:	Australia Post maintains a Postal Address File (PAF) database which contains Australian postal delivery addresses and their corresponding eight (8) character unique identification number known as a Delivery Point Identifier (DPID). While the PAF is concerned with postal address, for many persons' a postal address will be the same as their residential address. The PAF can be used to improve the recording of address data at the time of data entry. The Postal Address File may be used at the time of data entry to confirm that the combined metadata items of address line, suburb/town/locality, Australian state/territory identifier and postcode - Australian are accurately recorded.
