Person (address)—address line, text X[X(179)]

Identifying and definitional attributes

Metadata item type:	Data Element
Short name:	Address line (person)
Synonymous names:	Australian address line
METEOR identifier:	286620
Registration status:	Community Services (retired), Standard 30/09/2005 Health, Standard 04/05/2005
Definition:	A composite of one or more standard **address** components that describes a low level of geographical/physical description of a location, as represented by text. Used in conjunction with the other high-level address components i.e. Suburb/town/locality, Postcode—Australian, Australian state/territory, and Country, forms a complete geographical/physical address of a person.
Data Element Concept:	Person (address)—address line
Value Domain:	Text X[X(179)]

Value domain attributes

Representational attributes

Representation class:	Text
Data type:	String
Format:	X[X(179)]
Maximum character length:	180

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Data element attributes

Collection and usage attributes

Guide for use:

A high-level address component is defined as a broad geographical area that is capable of containing more than one specific physical location. Some examples of a broad geographical area are:

- Suburb, town or locality

- Postcode—Australian or international

- State, Territory, local government area, electorate, statistical local area

- Postal delivery point identifier

- Countries, provinces, etc other than in Australia

These components of a complete address do not form part of the Address line.

When addressing an Australian location, following are the standard address data elements that may be concatenated in the Address line:

- Building/complex sub-unit type

- Building/complex sub-unit number

- Building/property name

- Floor/level number

- Floor/level type

- House/property number

- Lot/section number

- Street name

- Street type code

- Street suffix code

One complete identification/description of a location/site of an address can comprise one or more than one instance of address line.

Instances of address lines are commonly identified in electronic information systems as Address-line 1, Address-line 2, etc.

The format of data collection is less important than consistent use of conventions in the recording of address data. Hence, address may be collected in an unstructured manner but should ideally be stored in a structured format.

Where Address line is collected as a stand-alone item, software may be used to parse the Address line details to separate the sub-components.

Multiple Address lines may be recorded as required.

Collection methods:

The following concatenation rules should be observed when collecting address lines addressing an Australian location.

- Building/complex sub-unit type is to be collected in conjunction with Building/complex sub-unit number and vice versa.

- Floor/level type is to be collected in conjunction with Floor/level number and vice versa.

- Street name is to be used in conjunction with Street type code and Street suffix code.

- Street type code is to be used in conjunction with Street name and Street suffix code.

- Street suffix code is to be used in conjunction with Street name and Street type code.

- House/property number is to be used in conjunction with Street name.
