Person with cancer—primary tumour status, T stage (UICC TNM Classification of Malignant Tumours, 6th ed) code XX[X]

Exported from METEOR (AIHW's Metadata Online Registry)

Person with cancer—primary tumour status, T stage (UICC TNM Classification of Malignant Tumours, 6th ed) code XX[X]

Identifying and definitional attributes

Metadata item type:	Data Element
Short name:	Cancer staging—T stage code
METEOR identifier:	341306
Registration status:	[Health,](#) Superseded 07/12/2011
Definition:	Extent of primary cancer including tumour size, at the time of diagnosis, as represented by a code.
Data Element Concept:	[Person with cancer—primary tumour status](#)
Value Domain:	[T stage (UICC TNM Classification of Malignant Tumours, 6th ed) code XX[X]](#)

Value domain attributes

Representational attributes

Classification scheme:	[International Union against Cancer (UICC) TNM Classification of Malignant Tumours 6th edition](#)
Representation class:	Code
Data type:	String
Format:	XX[X]
Maximum character length:	3

	Value	Meaning
Supplementary values:	88	Not applicable

Collection and usage attributes

Guide for use:	Valid T codes from the current edition of the UICC TNM Classification of Malignant Tumours.
	Refer to the TNM Supplement: A Commentary on Uniform Use, 3rd Edition for coding rules.

Data element attributes

Collection and usage attributes

Guide for use:	TNM staging applies to solid tumours excluding brain tumours.
	Choose the lower (less advanced) T category when there is any uncertainty.
	T stage value is derived from value of "Solid tumour size (at diagnosis) total millimetres". Refer to usage attributes for this data element for additional detail
Collection methods:	From information provided by the treating doctor and recorded on the patient's medical record.

Comments: Cancer prognosis and survival can be related to the extent of the disease at diagnosis. Survival rates are generally higher if the disease is localised to the organ of origin compared with cases in which the tumour has spread beyond the primary site.

Staging systems seek to classify patients having a similar prognosis into groups or stages. TNM staging is an internationally agreed staging classification system based on the anatomical site of the primary tumour and its extent of spread. The T component refers to the size of the tumour and whether or not it has spread to surrounding tissues. The N component describes the presence or absence of tumour in regional lymph nodes. The M component refers to the presence or absence of tumour at sites distant from the primary site.
