Address—geocode latitude, decimal degrees XN[N][.N(9)]

Exported from METEOR (AIHW's Metadata Online Registry)

Address—geocode latitude, decimal degrees XN[N] [.N(9)]

Identifying and definitional attributes

Metadata item type:	Data Element
Short name:	Geocode latitude decimal degrees
Synonymous names:	Latitude
METEOR identifier:	430445
Registration status:	Aged Care, Standard 30/06/2023 Community Services (retired), Standard 06/02/2012 Disability, Standard 13/08/2015 Health, Standard 05/10/2016 Housing assistance, Standard 01/05/2013
Definition:	The geographic latitude of an address point on the earth, measured in decimal degrees north or south of the equator.
Data Element Concept:	Address—geocode latitude
Value Domain:	Latitude decimal degrees XN[N][.N(9)]

Value domain attributes

Representational attributes

Representation class:	Identifier
Data type:	Geospatial
Format:	XN[N][.N(9)]
Maximum character length:	12
Unit of measure:	Decimal degree

Collection and usage attributes

Guide for use:	The 'X' in the latitude format symbolises the designator symbol "+" or "-" and should be placed prior to the first number. Latitudes north of the equator are positive and shall be designated by use of the plus sign (+), latitudes south of the equator are negative and shall be designated by use of the minus sign (-). The equator shall be designated by use of the plus sign (+). The format XN[N][.N(9)] allows for 1 or 2 digit latitudes (i.e. degree values) with the option of 0 to 9 decimal places (i.e. decimal degree values). Usage examples: +14.091360569 +2 -50.321

Data element attributes

Collection and usage attributes

Comments: Geographical coordinates (latitudes and longitudes) are the universal system for
defining spatial position. A set of geographic coordinates on a datum is complete
and unique, worldwide.

Positions of geographic features can be defined in space by a set of coordinates.
In order for coordinates to be unique, the coordinate reference system needs to be
fully defined.

A coordinate reference system is realised by a reference frame, which comprises a
datum and a coordinate system.

Latitudes can also be expressed in degrees, minutes and seconds (e.g. + 66° 33′
39″), see METeOR for this related item. A conversion to decimal degrees from the
degrees, minutes and seconds format can be calculated with the following formula:
Decimal Degrees = Degrees + ((Minutes / 60) + (Seconds / 3600)). (REF:
https://www2.landgate.wa.gov.au/slip/portal/
home/Graticule.html)

Usage example: -75° 59' 32.483" converts to -75.992356389 in decimal degrees
(rounded up to 9 decimal places).
