Person with cancer—molecular pathology test results, (other) code X[X(19)]

Identifying and definitional attributes

Metadata item type: Data Element

Short name: Molecular test results description

Synonymous names: Molecular pathology; Molecular profiling

METEOR identifier: 450360

Registration status: Health, Standard 08/05/2014

Definition: The results of a <u>molecular pathology</u> test for genetic and molecular abnormalities

in a person with cancer, as represented by text.

Data Element Concept: Person with cancer—molecular pathology test results

Value Domain: Molecular test results (other) code X[X(19)]

Value domain attributes

Representational attributes

Representation class: Code

Data type: String

Format: X[X(19)]

Maximum character length: 20

Collection and usage attributes

Guide for use: Record the HUGO Gene Nomenclature Committee (HGNC) assigned, unique gene

symbol (or gene abbreviation, short gene name) corresponding to each genetic or molecular abnormality detected. The symbol is available from their curated online

repository at http://www.genenames.org.

Gene symbols are designated by upper-case Latin letters or by a combination of upper-case letters and Arabic numerals, with the exception of the # symbol. They do not contain punctuation except for the HLA, immunoglobulin and T cell receptor gene symbols, which may be hyphenated. Generally, gene symbols will be no

longer than six characters.

Data element attributes

Collection and usage attributes

Guide for use: Record results of a molecular pathology test for genetic and molecular

abnormalities in a person with cancer in text.

Molecular testing is usually performed for cancer when the result may influence

treatment.

This should be collected for people with cancer where pathology data is available.

Collection methods: This information should be sought from the patient's pathology report.

Comments: The presence of genetic or molecular abnormalities may be of clinical significance

and influence treatment decisions.
