**Definition:** The stage of a patient's illness. The palliative care phase refers to a distinct clinical period which reflects the stage of the patient's illness. Palliative care phase provides a good indication of the type of care required by a palliative care patient.

An episode of admitted patient palliative care may comprise of a single phase or multiple phases, depending on changes in the patient's condition. Phases are not sequential and a patient may move back and forth between phases within the one episode of admitted patient palliative care.

The palliative care phases are stable, unstable, deteriorating, terminal and bereavement.

**Context:** Palliative care phase is a common assessment measure recorded for episodes of admitted patient palliative care. Palliative care is care in which the clinical intent or treatment goal is primarily quality of life for a patient with an active, progressive disease with little or no prospect of cure. It is usually evidenced by an interdisciplinary assessment and/or management of the physical, psychological, emotional and spiritual needs of the patient; and a grief and bereavement support service for the patient and their carers/family.
