National Healthcare Agreement: PI 09-Incidence of heart attacks, 2014

Identifying and definitional attributes

Metadata item type:	Indicator
Indicator type:	Progress measure
Short name:	PI09- Incidence of heart attacks, 2014
METEOR identifier:	517669
Registration status:	Health , Superseded 14/01/2015
Description:	Incidence of heart attacks.
Indicator set:	National Healthcare Agreement (2014) Health , Superseded 14/01/2015
Data quality statement:	National Healthcare Agreement: PI 09-Incidence of heart attacks, 2014 QS Health , Superseded 14/01/2015

Collection and usage attributes

Computation description:	Rates directly age-standardised to the 2001 Australian population. Count (a) number of deaths where 'acute coronary heart disease' (ICD-10 codes I20–I24) is the underlying cause of death in each calendar year (based on year of registration of death). Count (b) number of non-fatal hospitalisations where 'acute myocardial infarction' (ICD-10-AM I21) or 'unstable angina' (ICD-10-AM I20.0) are the principal diagnosis, and separation mode is not equal to 'died' or 'transferred to another acute hospital', and care type is not equal to 'new born-unqualified days only' or 'organ procurement – posthumous' or 'hospital boarder' in each calendar year (based on discharge date from hospital). The number of acute coronary events is estimated by (a) + (b).
Computation:	$100,000 \times (\text{Numerator} \div \text{Denominator})$
Numerator:	Number of deaths recorded with an underlying cause of acute coronary heart disease (a) plus the number of non-fatal hospitalisations with a principal diagnosis of acute myocardial infarction or unstable angina that do not end in a transfer to another acute hospital (b). For ages greater than 24 years.

Comments: Most recent data available for 2014 Council of Australian Governments (COAG) Reform Council (CRC) report: 2011.

This is a measure of the number of acute coronary events in a year. An individual may have more than one event during a year.

This indicator has previously been published at the national level by age and sex. Assessment of appropriateness to disaggregate below this level will be undertaken prior to reporting.

The computation method has recently been revised and should be considered 'preliminary' until work on validation is complete. The computation method for age-standardisation of data reported by Indigenous status has been refined since the previous cycle.

Note that updated ERP by Indigenous status is not available for this cycle. Data by Indigenous status is calculated using ERP determined prior to the final rebased ERP provided after the 2011 Census. It is expected that final rebased ERP by Indigenous status will be available for the next cycle of reporting.

Accountability attributes

Reporting requirements: National Healthcare Agreement

Organisation responsible for providing data: Australian Institute of Health and Welfare

Further data development / collection required: Specification: Substantial work required, the measure requires significant work to be undertaken to validate both nationally and for disaggregation by jurisdiction.

The method has been recently reviewed and is preliminary, until validation work is complete. Any further improvements in diagnostic sensitivity and treatment patterns for acute coronary events will need to be taken into account in trend analysis.
