Rates are directly age-standardised to the 2001 Australian population.

Variability bands are to be calculated for single-year rates using the method below.

Presented per 100,000 population.

Computation:

Number

100,000 x (Numerator ÷ Denominator)

Variability bands are to be calculated for single-year rates using the following method for estimating 95% confidence intervals:

Age-standardised rate

$$CI(ASR)_{95\%} = ASR \pm 1.96 \times \sqrt{\sum_{i=1}^I \frac{w_i^2 d_i}{n_i}}$$

Where w_i = the proportion of the standard population in age group i

d_i = the number of deaths in age group i

n_i = the number of people in the population in age group i

Numerator:

Number of deaths of persons aged less than 75 categorised as potentially avoidable

Comments:

Most recent data available for 2015 National Healthcare Agreement (NHA) performance reporting:

- 2012 (Total population and Indigenous status at national level)
- Aggregated data 2008–2012 (Indigenous status)

Due to small number of Indigenous deaths reported each year, 5 year combined data will be reported for state and territory disaggregations.

ERP for total population is sourced from ERP rebased after the 2011 Census. ERP for Indigenous data is sourced from 2011 based ERP.

Data by remoteness may be available, pending assessment of data quality.
