

# Immunotherapy for cancer cluster

## Identifying and definitional attributes

**Metadata item type:** Data Set Specification

**METEOR identifier:** 561356

**Registration status:**

- [Health](#), Standard 08/05/2014

**DSS type:** Data Element Cluster

**Scope:** Immunotherapy, also known as biological therapy, biotherapy or biological response modifier therapy, is cancer treatment that achieves its antitumour effect by altering the immune system or changing the host's response to the tumour cells.

The immunotherapy cluster consists of those data elements recommended for collection as best practice when the patient is administered immunotherapy as part of the course of treatment for cancer. The immunotherapy cluster collects information on the immunotherapy agent or protocol and the start and finish dates of treatment.

Information on the immunotherapy agent is required to evaluate patterns of care, the effectiveness of different treatment modalities and treatment by patient outcome. Collecting the start and finish dates will enable an estimate of the duration of immunotherapy and the time interval from diagnosis to treatment.

The use of standard definitions and formats supports the consistent collection and management of data and enables the integration of data from different sources. It provides a common language facilitating the interpretation and analysis of results, data linkage for statistical purposes, longitudinal studies and patient patterns of care and outcome studies. These results may then inform professional guidelines and training, quality assurance and the planning and evaluation of cancer control activities; potentially improving outcomes for patients.

## Collection and usage attributes

**Guide for use:** Standard protocols are available online at eviQ Cancer Treatments Online ([www.eviQ.org.au](http://www.eviQ.org.au)). This website is powered by the Cancer Institute NSW and endorsed by Cancer Australia, and provides current, evidence based, best practice cancer treatment protocols and information. It is recommended that only regimen or protocol names listed in eviQ be used to record immunotherapy agents; in all other cases, record the full generic name of each individual immunotherapy agent for each course of treatment.

**Collection methods:** Immunotherapy agents and cycles are recorded for each course of immunotherapy administered during the course of treatment regardless of treatment intent or timing.

The data element *Healthcare provider—organisation identifier, N(16)* may be recorded for each treatment/cycle. It is recommended that, wherever possible, the database be configured to allow entry of different healthcare provider identifiers for each therapeutic mode/course of treatment/cycle.

The start date and completion date of immunotherapy are recorded once only for immunotherapy administered during the course of treatment.

This information should be collected from the patient's medical record.
