Distress thermometer code N[N]

Identifying and definitional attributes

Metadata item type:	Value Domain
METEOR identifier:	573491
Registration status:	Health , Standard 04/02/2015
Definition:	A code set representing the values on the distress thermometer.

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N[N]
Maximum character length:	2

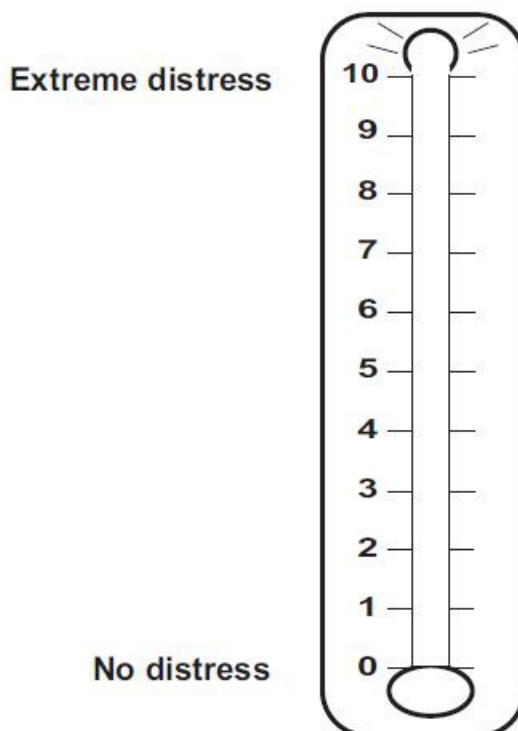

Collection and usage attributes

Guide for use:	Using a visual distress thermometer (see the Collection methods section below for an example), ask the person to indicate the level of distress that they have experienced in the past week on a scale from 0-10, where 0 indicates 'No distress' and 10 indicates 'Extreme distress'. Valid values are 0 to 10.
-----------------------	---

Collection Methods:

Using the image below as a reference, patients are given the instruction "Circle the number (0-10) that best describes how much distress you have been experiencing in the past week including today" and are given the opportunity to circle a number on the paper or an electronic distress thermometer.

Instructions: First please circle the number (0-10) that best describes how much distress you have been experiencing in the past week including today.

**Comments:**

The distress thermometer has been found to have reasonable sensitivity and specificity for general distress, depression and anxiety (Mitchell, 2007) and to be comparable, as a screening tool, with longer measures of psychological symptoms (Mitchell, 2010). It should be noted that while the distress thermometer is valuable as a screening tool, it is not a replacement for careful clinical assessment and management.
