KPIs for Australian Public Mental Health Services:

PI 02J – 28 day readmission rate, 2015

Identifying and definitional attributes

Metadata item type:	Indicator
Indicator type:	Indicator
Short name:	MHS PI02J: 28 day readmission rate, 2015
METEOR identifier:	585913
Registration status:	Health , Superseded 11/05/2016
Description:	<p>Proportion of in-scope overnight separations from state/territory acute admitted patient mental health care service unit(s) that are followed by readmission to the same or to another public sector acute admitted patient mental health care service unit within 28 days of discharge.</p> <p>NOTE: This specification has been adapted from the indicator MHS PI02: 28 day readmission rate, 2015 (Service level version) using terminology consistent with the National Health Data Dictionary. There are no technical differences in the calculation methodologies between the Service level version and the Jurisdictional level version of this indicator.</p>
Rationale:	<p>Readmissions to a psychiatric facility following a recent discharge may indicate that inpatient treatment was incomplete or ineffective, or that follow-up care was inadequate to maintain the person's treatment out of hospital. In this sense, rapid readmissions may point to deficiencies in the functioning of the overall care system.</p> <p>Avoidable rapid readmissions place pressure on finite beds and may reduce access to care for other consumers in need.</p> <p>International literature identifies one month as an appropriate defined time period for the measurement of unplanned readmissions following separation from an acute psychiatric inpatient service.</p>
Indicator set:	<p>Key Performance Indicators for Australian Public Mental Health Services (Jurisdictional level version) (2015)</p> <p>Health, Superseded 11/05/2016</p>

Collection and usage attributes

Computation description: Coverage/Scope:

State/territory public acute admitted patient mental health care service units.

The following separations are excluded:

- Same day [separations](#);
- Statistical and change of care type separations;
- Separations that end by transfer to another acute or psychiatric hospital;
- Separations that end in death, left against medical advice/discharge at own risk,
- Separations where the length of stay is one night only and a procedure code for Electroconvulsive Therapy (ECT) is recorded.

Methodology:

- Reference period for 2015 performance reporting: 2013–14
- Readmission is considered to have occurred if the person is admitted to any public acute admitted patient mental health care service unit within the state/territory. Consequently, a state-wide unique patient identifier is required for accurate construction of this indicator.
- For the purpose of this indicator, when a mental health service organisation has more than one unit of a particular admitted patient care program, those units should be combined.
- The categorisation of the admitted patient mental health care service unit is based on the principal purpose(s) of the admitted patient care program rather than the care type of the individual consumers.
- The following ECT procedure codes are relevant for the excluded separations specified above:
 - ACHI 5th edition (2006–2008) use procedure codes 93340-02 and 93340-43.
 - ACHI 6th and 7th editions (2008 to current) use procedure codes 93341-00 to 93341-99.
 - ACHI 5th, 6th and 7th editions (2006 to current) Electroconvulsive therapy Block 1907 may be selected to capture all data regardless of code changes over time.
- No distinction is made between planned and unplanned readmissions.

Computation:

$(\text{Numerator} \div \text{Denominator}) \times 100$

Numerator:

Number of in-scope overnight separations from state/territory acute admitted patient mental health care service unit(s) occurring within the reference period, that are followed by a readmission to the same or another acute mental health care service unit within 28 days.

Numerator data elements:

Data Element / Data Set

Data Element

Number of separations with a readmission to an acute admitted patient mental health care service unit within 28 days

Data Source

[State/territory admitted patient data](#)

Guide for use

Determining whether there was a readmission for in-scope separations requires data for the 28 days of the next financial year to be included in determining whether a readmission has occurred.

Denominator:

Number of in-scope overnight separations from state/territory acute admitted patient mental health care service unit(s) occurring within the reference period.

Denominator data elements:

Data Element / Data Set

Data Element

Number of separations from acute public admitted patient mental health care service unit(s)

Data Source

[State/territory admitted patient data](#)

Guide for use

In-scope separations are identified prior to determining whether a readmission has occurred. The total number of in-scope separations is expected to comprise separations for the full 12 months of the dataset year.

Disaggregation:

Consumer attributes: Age, sex, SEIFA, remoteness, Indigenous status.
Disaggregated data excludes missing or not reported data.

All disaggregation data are to be calculated as at the admission for the first index separation, even if the value is null. The index separation refers to the separation data point included in the denominator data set. The data at admission for the index separation should be used for the associated numerator data pair, when present, and any subsequent denominator and data pairs for a uniquely identifiable person.

Disaggregation data elements:

Representational attributes

Representation class: Percentage

Data type: Real

Unit of measure: Service event

Indicator conceptual framework

Framework and dimensions: [Effective](#)
[Continuous](#)

Accountability attributes

Reporting requirements: State/territory supplied data.

Organisation responsible for providing data: Australian Institute of Health and Welfare

Accountability: Australian Institute of Health and Welfare

Benchmark: State/territory level

Further data development / collection required: This indicator cannot be accurately constructed using the Admitted Patient Mental Health Care NMDS. While the data set comprehensively provides a collection of separations from Australian public hospitals; its inability to uniquely identify a patient across episodes and across hospitals limits its capacity to count readmissions.

There is no proxy solution available. In order to report this indicator at a national level, states and territories are required to individually provide separate indicator data.

A reliable system of patient identifiers within the Admitted Patient Mental Health Care NMDS is required to enable unique identification of individual consumers across multiple years, multiple admitted episodes and multiple hospitals.

When data for this indicator are requested, jurisdictions are required to answer whether a state-wide unique client identifier system is in place, or some comparable approach has been used in the data analysis to allow tracking of service utilisation by an individual consumer across all public specialised mental health services in the jurisdiction. Collection of this information is aimed at assessing the degree of consistency between jurisdictions in data reported the result of which are explored in the data quality statement for this indicator.

Other issues caveats: Due to data limitations this indicator cannot differentiate between planned and unplanned readmissions. This indicator does not track readmissions across state and territory boundaries or track movement between public and private hospitals.
