

# National Health Performance Authority, Healthy Communities: Percentage of adults admitted to hospital, 2013–14

## Identifying and definitional attributes

<b>Metadata item type:</b>	Indicator
<b>Indicator type:</b>	Indicator
<b>Short name:</b>	Percentage of adults admitted to hospital, 2013–14
<b>METEOR identifier:</b>	611078
<b>Registration status:</b>	<ul style="list-style-type: none"><li>• <a href="#">National Health Performance Authority (retired)</a>, Retired 01/07/2016</li></ul>
<b>Description:</b>	Percentage of people over 15 years of age who reported they were admitted to any hospital in the preceding 12 months.
<b>Indicator set:</b>	<a href="#">National Health Performance Authority: Healthy Communities: 2011–</a> <a href="#">National Health Performance Authority (retired)</a> , Retired 01/07/2016

## Collection and usage attributes

<b>Population group age from:</b>	For this indicator an adult is defined as a person aged 15 years and over
<b>Computation description:</b>	<p>Participants in the Australian Bureau of Statistics (ABS) Patient Experience Survey 2013–14 who reported that they were admitted to any hospital for their own health in the preceding 12 months.</p> <p>The numerator refers to the number of adults who were admitted to any hospital for their own health in the preceding 12 months.</p> <p>The numerator was calculated as the sum of calibrated sample weights for persons aged 15 years and over who responded that they were admitted to any hospital for their own health in the preceding 12 months and who were enumerated within the particular Primary Health Network catchment.</p> <p>Population is limited to persons aged 15 years and over.</p> <p>The denominator was calculated as the sum of calibrated sample weights for persons aged 15 years and over who were enumerated within the Primary Health Network catchment.</p> <p>Person level survey weights were calibrated to independent estimates of the population of interest, referred to as 'benchmarks'. Weights calibrated against population benchmarks ensure that the survey estimates conform to independently estimated distributions of the population, rather than to the distribution within the sample itself. These benchmarks account for the distribution of people across state and territory, age group, and sex categories. Note: These benchmarks have not been calibrated for Primary Health Network geography.</p> <p>Analysis by remoteness and Socio-Economic Indexes for Areas (SEIFA) Index of Relative Socio-Economic Disadvantage (IRSD) is based on usual residence of the person.</p> <p>The measure is presented as a percentage.</p> <p>95% confidence intervals and relative standard errors are calculated for rates.</p> <p>The National Health Performance Authority developed a suppression protocol to ensure robust reporting of these data at small areas.</p>

- These suppression rules are based on limits for Relative Standard Error<sup>1</sup> and Confidence Interval width of 30%, with additional cross-validation for estimates close to these limits, that is plus or minus 3% of the limits. If an estimate was marginal<sup>2</sup> with respect to Relative Standard Error, the Confidence Interval width was used as the deciding factor. If an estimate was marginal<sup>2</sup> with respect to Confidence Interval width, then Relative Standard Error is used as the deciding factor
- Data were suppressed based on the following rules:
  - Relative Standard Error of 33% or greater, or
  - Confidence Interval (95%) width of 33% or greater, or
  - Relative Standard Error between 27% and 33%, with significantly<sup>3</sup> wider Confidence Interval width than the average for that indicator, or
  - Confidence Interval width between 27% and 33%, with significantly<sup>3</sup> wider Relative Standard Error than the average for that indicator.

1. For a dichotomous proportion, Relative Standard Error can be defined as the ratio of the standard error and the minimum of the estimate and its complement (100%–estimate).

2. In this context, marginal is defined as within 10% of the 30% limit, or +/- 3%

3. In this context, statistical significance is defined as at least two standard deviations above average.

The ABS Patient Experience survey does not include individuals living in discrete indigenous communities. As a result, estimates derived for Northern Territory may not be adequately representative. Results for Northern Territory have been excluded from the tables and maps on the [www.MyHealthyCommunities.gov.au](http://www.MyHealthyCommunities.gov.au) website. Data for Northern Territory (excluding discrete indigenous communities) are available in the excel downloads available via the [www.MyHealthyCommunities.gov.au](http://www.MyHealthyCommunities.gov.au) website.

**Computation:**

(Numerator ÷ Denominator) x 100

**Numerator:**

Number of people over 15 years of age who reported they were admitted to any hospital in the preceding 12 months.

**Numerator data elements:**

Data Element / Data Set
<a href="#">Person—self-reported hospital admission, yes/no code N</a>
<b>Data Source</b>
<a href="#">ABS Patient Experience Survey (PEX)</a>
<b>Guide for use</b>
Data source type: Survey

**Denominator:**

Total number of adults aged 15 years and over who were enumerated within the Primary Health Network catchment.

**Denominator data elements:**

Data Element / Data Set
<b>Data Source</b>
<a href="#">ABS Patient Experience Survey (PEX)</a>

**Disaggregation:**

By Primary Health Network catchments.

Disaggregation data elements:
