

Address status cluster

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METEOR identifier:	611143
Registration status:	<ul style="list-style-type: none">Health, Standard 05/10/2016
DSS type:	Data Element Cluster
Scope:	The Address status cluster includes data elements that define whether an address is current. An address is defined as a collection of information used for describing the location of an entity, and/or details describing how the entity can be contacted.

Collection and usage attributes

Guide for use:	One method of identifying the currency of an address is the use of specific start and end dates relating to an address. A currency flag or sequence number which identifies the addresses in active use can also be used. Some systems include both options to better support validation. The use of start and end dates are included as they are the clearest mechanism for supporting identification and communication.
