

Address group cluster

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METEOR identifier:	611145
Registration status:	<ul style="list-style-type: none">• Health, Standard 05/10/2016
DSS type:	Data Element Cluster
Scope:	The Address group cluster includes data elements that record an address, which is defined as a collection of information used for describing the location of an entity, and/or details describing how the entity can be contacted, for individuals or organisations.

Collection and usage attributes

Guide for use:	<p>Each address should be associated with a specific individual or organisation. It is also important to be able to identify whether an address is current. One method is the use of specific start and end dates relating to an address. A currency flag or sequence number which identifies the addresses in active use can also be used. Some systems include both options to better support validation. The use of start and end dates are included as they are the clearest mechanism for supporting identification and communication.</p> <p>The data elements support recording of no fixed address and less specific contact details.</p>
