Hip fracture care clinical care standard indicators: 6a-Proportion of patients with a hip fracture receiving bone protection medicine prior to separation from the hospital at which they underwent surgery

Identifying and definitional attributes

Metadata item type: Indicator Indicator type: Indicator

Short name: Indicator 6a-Proportion of patients with a hip fracture receiving bone protection

medicine prior to separation from the hospital at which they underwent surgery

METEOR identifier: 628253

Registration status: Health, Standard 12/09/2016

Description: Proportion of patients with a hip fracture receiving a prescription for, or were

administered bone protection medicine prior to separation from the hospital at

which they underwent hip fracture surgery.

Rationale: Hip fractures are most often secondary to a fall and are indicative of underlying

osteoporosis. Bone protection medicine has been shown to reduce the risk of

another fracture (Metcalfe 2008; ACSQHC 2009).

Indicator set: Clinical care standard indicators: hip fracture

Australian Commission on Safety and Quality in Health Care, Superseded

18/06/2018

Health, Standard 12/09/2016

Outcome area: Minimising risk of another fracture

Health, Standard 12/09/2016

Collection and usage attributes

Computation description:

The numerator includes patients with a hip fracture who receive bone protection medicine prior to separation from the hospital at which they underwent hip fracture surgery. Bone protection medicine can include (ANZHFR Steering Group 2013).

- Bisphosphonates: alendronate (oral), risedronate (oral), zoledronate (intravenous) (with or without vitamin D and/or calcium where indicated).
- Denosumab (with or without vitamin D and/or calcium where indicated).
- Strontium ranelate (with or without vitamin D and/or calcium where indicated).
- Teriparatide (with or without vitamin D and/or calcium where indicated).

Both the numerator and the denominator exclude episodes where <u>Episode of</u> admitted patient care—separation mode, code N=8 Died.

Presented as a percentage.

Computation: (Numerator ÷ denominator) x 100

Numerator: Number of patients with a hip fracture who receive a prescription for, or were

administered bone protection medicine prior to separation from the hospital at

which they underwent surgery for hip fracture.

Denominator: Number of patients with a hip fracture separated from the hospital at which they

underwent surgery for hip fracture.

Comments: This indicator measures the proportion of patients receiving bone protection

medicine upon separation from hospital, which has evidence of fracture risk reduction in patients with minimal trauma fracture. Many patients will also require vitamin D supplementation to correct vitamin D deficiency and to prevent hypocalcaemia due to the bone protection medicine. Some patients will also require calcium supplements if the recommended calcium intake cannot be achieved through diet (MJA 2013).

The expected result for this indicator is not 100%. Some patients may prefer not to take a bone protection medicine or may have contraindications. Vitamin D deficiency and hypocalcaemia must be corrected before commencing some bone protection medicines.

For hospitals collecting the Australian and New Zealand Hip Fracture Registry (ANZHFR) data set (ANZHFR Steering Group 2013), the variable *Bone protection medication at discharge from acute hospital* can be used for the numerator of this indicator.
