

Product of conception— gestational age, total completed weeks N[N]

Identifying and definitional attributes

Metadata item type:	Data Element
Short name:	Gestational age
METEOR identifier:	695332
Registration status:	<ul style="list-style-type: none">• Health, Standard 12/12/2018• Tasmanian Health, Standard 03/07/2020
Definition:	The gestational age of a product of conception in completed weeks.
Data Element Concept:	Product of conception—gestational age

Collection and usage attributes

Guide for use:

Gestational age is the best clinical estimate of the duration of pregnancy at a specific point in time, based on the first day of the last menstrual period (LMP), ultrasound or physical examination of the baby.

Gestational age is conventionally expressed in completed weeks. When gestational age is calculated using the first day of the LMP, the first day is counted as day zero and not day one. Therefore, a 25 week, 5 day fetus is considered a 25 week fetus (25+0, 25+1, 25+2, 25+3, 25+4, 25+5, 25+6).

When ultrasound is used to date a pregnancy, the earliest ultrasound examination should be used and should preferably be between 6 and 10 weeks gestation. Scans performed beyond 24 weeks gestation are unlikely to be reliable in estimating gestational age and should not be used for this purpose.

The World Health Organization identifies the following categories for duration of gestation:

- pre-term: less than 37 completed weeks (less than 259 days) of gestation
- term: from 37 completed weeks to less than 42 completed weeks (259 to 293 days) of gestation
- post-term: 42 completed weeks or more (294 days or more) of gestation.

Comments:

Gestational age is a key marker in pregnancy and an important risk factor for neonatal outcomes.

Implementation in Data Set Specifications:

[Perinatal NMDS 2019–20](#)
[Health](#), Superseded 03/12/2020

Implementation start date: 01/07/2019

Implementation end date: 30/06/2020

DSS specific information:

The first day of the last menstrual period (LMP) is required to estimate gestational age, which is a key marker in pregnancy and an important risk factor for neonatal outcomes. Although the date of the LMP may not be known, or may sometimes be erroneous, estimation of gestational age based on clinical assessment may also be inaccurate. Gestational age is usually estimated based on available information on LMP and clinical assessment.

In the case of multiple births, this data element should be recorded for each baby born.

This data element is recorded for the mother only.

The following code has been agreed by the National Perinatal Data Development Committee (NPDDC) as a supplementary code for use in the Perinatal NMDS:
