

Birthweight

Identifying and definitional attributes

Metadata item type: Glossary Item

METEOR identifier: 696102

Registration status:

- [Health](#), Superseded 03/12/2020
- [Indigenous](#), Standard 02/04/2019
- [Tasmanian Health](#), Standard 24/06/2020

Definition: The first weight of a [live born](#) or [stillborn](#) baby obtained after birth. The World Health Organization further defines the following categories:

- extremely low birthweight: less than 1,000 grams (up to and including 999 grams),
- very low birthweight: less than 1,500 grams (up to and including 1,499 grams),
- low birthweight: less than 2,500 grams (up to and including 2,499 grams).

Context: Perinatal

Collection and usage attributes

Comments: The definitions of low, very low, and extremely low birthweight do not constitute mutually exclusive categories. Below the set limits they are all-inclusive and therefore overlap (i.e. low includes very low and extremely low, while very low includes extremely low).

For live births, birthweight should preferably be measured within the first hour of life before significant postnatal weight loss has occurred. While statistical tabulations include 500 gram groupings for birthweight, weights should not be recorded in those groupings. The actual weight should be recorded to the degree of accuracy to which it is measured.

Source and reference attributes

Submitting organisation: National Perinatal Data Development Committee

Origin: WHO (World Health Organization) 1992. International Classification of Diseases and Related Health Problems, 10th Revision. Geneva: WHO.
