Remoteness classification (ASGS-RA) N

Identifying and definitional attributes

Metadata item type:	Value Domain
Synonymous names:	Remoteness area; Remoteness structure
METEOR identifier:	697105
Registration status:	Health , Standard 06/09/2018 Housing assistance , Standard 10/05/2019 Indigenous , Standard 07/04/2024
Definition:	Australian Statistical Geography Standard—Remoteness Area (ASGS-RA) is a geographical classification which defines locations in terms of relative remoteness, i.e. the road distance of a location from the nearest Urban Centre and Locality .
Context:	Geographic remoteness is essentially a measure of a location's level of access to services. Larger population centres tend to have a greater level of service provision than small centres. Typically, a population centre is not likely to provide a full range of services until its population reaches around 250,000 people. Information in relation to the definition and calculation of remoteness is available from the Geography portal on the ABS website. Information in relation to how ARIA+ scores are calculated for populated localities is available from the Hugo Centre for Migration and Population Research website.

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
	Value	Meaning
Permissible values:	1	Major cities of Australia
	2	Inner regional Australia
	3	Outer regional Australia
	4	Remote Australia
	5	Very remote Australia
	6	Migratory
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

Remoteness measures are calculated using Accessibility/Remoteness Index of Australia (ARIA+) scores, which are based on the road distance from a populated locality to the nearest Urban Centre. The lower the ARIA+ score for a populated locality the greater the access to services.

CODE 1 Major cities of Australia

'Major cities of Australia' includes Statistical Area Level 1s (SA1s) with an average Accessibility/Remoteness Index of Australia (ARIA+) index value of 0 to 0.2.

CODE 2 Inner regional Australia

'Inner regional Australia' includes SA1s with an average ARIA+ index value greater than 0.2 and less than or equal to 2.4.

CODE 3 Outer regional Australia

'Outer regional Australia' includes SA1s with an average ARIA+ index value greater than 2.4 and less than or equal to 5.92.

CODE 4 Remote Australia

'Remote Australia' includes SA1s with an average ARIA+ index value greater than 5.92 and less than or equal to 10.53.

CODE 5 Very remote Australia

'Very remote Australia' includes SA1s with an average ARIA+ index value greater than 10.53.

CODE 6 Migratory

'Migratory' is composed of off-shore, shipping and migratory SA1s.

Migratory includes people in transit on long distance trains, buses, aircraft and long haul road transport vehicles on Census night.

Offshore includes people on oil rigs and drilling platforms etc. It is also used for expeditioners in the Australian Antarctic Territory.

Shipping includes people who are on board vessels in Australian waters, in or between Australian ports on Census night.

Collection Methods:

The list of permissible values for this value domain, i.e. codes 1 to 6, is intended to be directly mappable to the values used by the ABS to describe remoteness areas, i.e. codes 0 to 5, where Code 0 is Major Cities of Australia and Code 5 is Remote Australia.

Information in relation to how remoteness is defined and calculated is available from the Geography portal on the ABS website.

The ARIA+ is provided by the Hugo Centre for Migration and Population Research at the University of Adelaide website.

Comments:

The measures of remoteness used by the Australian Bureau of Statistics (ABS) are based on population counts obtained from the Census of Population and Housing, conducted every 5 years.

ARIA+ values range from 0 (high accessibility) to 15 (high remoteness), and is based on road distance measurements from over 12,000 populated localities to the nearest Service Centres in five size categories based on population size.

Prior to 2011, ARIA+ scores were calculated for individual Census Collection Districts (CCDs). Following the phasing out of the Australian Standard Geographical Classification and the introduction of the Australian Statistical Geography Standard (ASGS) by the ABS in 2011, ARIA+ scores are now calculated for individual SA1s.

Classification scheme attributes

Classification scheme:	Australian Statistical Geography Standard 2016
Synonymous names:	ASGS 2016
METEOR identifier:	659352
Definition:	The Australian Statistical Geography Standard (ASGS) is the geographical framework defined by the Australian Bureau of Statistics (ABS) for disseminating geographically classified statistics.

Registration status:	Tasmanian Health , Standard 27/06/2017 Commonwealth Department of Social Services (retired) , Standard 20/06/2018 Housing assistance , Standard 10/05/2019 Children and Families , Standard 20/01/2021 Health , Superseded 20/10/2021 Early Childhood , Superseded 15/08/2023
Context:	The ASGS provides a common framework of statistical geography that enables the publication of statistics that are comparable and geospatially integrated. It provides users with a coherent set of standard regions so that they can access, visualise, analyse and understand statistics.
Classification structure:	The ASGS is a hierarchical framework of regions. Its classification structures are split into two broad groups, the ABS Structures and the Non-ABS Structures. The ABS Structures are hierarchies of regions defined and maintained by the ABS. The regions that comprise the ABS Structures will remain unchanged until the next anticipated edition of the ASGS in 2021, which is timed for use in the next anticipated Census of Population and Housing in 2021. The ABS Structures are built directly from mesh blocks. Non-ABS Structures are approximated by either Mesh Blocks, the Statistical Areas Level 1 (SA1), or the Statistical Areas Level 2 (SA2). The ABS Structures comprise six interrelated hierarchies of regions. They are: • Main Structure • Indigenous Structure • Urban Centres and Localities/Section of State Structure • Remoteness Structure • Greater Capital City Statistical Area (GCCSA) Structure • Significant Urban Area Structure. The Non ABS Structures comprise eight hierarchies of regions which are not defined or maintained by the ABS, but for which the ABS is committed to providing a range of statistics. They generally represent administrative regions and are approximated by Mesh Blocks, SA1s or SA2s. They are: • Local Government Areas (LGAs) • Postal Areas • State Suburbs • Commonwealth Electoral Divisions • State Electoral Divisions • Australian Drainage Divisions • Natural Resource Management Regions • Tourism Regions.
