Australian Health Performance Framework: PI 3.1.7– Prevalence of type 2 diabetes, 2020

Identifying and definitional attributes

Metadata item type:	Indicator
Indicator type:	Indicator
Short name:	AHPF PI 3.1.7–Prevalence of type 2 diabetes, 2020
METEOR identifier:	728408
Registration status:	Health , Standard 13/10/2021
Description:	The proportion of people who have self-reported type 2 diabetes.
Indicator set:	Australian Health Performance Framework, 2020 Health , Superseded 11/07/2023

Collection and usage attributes

Computation description: The National Health Survey (NHS) is a series of Australia-wide health surveys conducted by the Australian Bureau of Statistics designed to collect a range of information about the health of Australians, including the prevalence of self-reported type 2 diabetes.

In the NHS, data on diabetes refers to persons who reported having been told by a doctor or nurse that they had diabetes, irrespective of whether the person considered their diabetes to be current or long-term.

Excludes women with gestational diabetes.

The data are reported for people aged 18 and over.

Rates are directly age-standardised to the 2001 Australian population.

Analysis by remoteness and Socio-Economic Indexes for Areas (SEIFA) Index of Relative Socio-Economic Disadvantage (IRSD) is based on usual residence of the person (based on data availability).

Presented as a percentage.

95% confidence intervals and relative standard errors calculated for rates.

Computation: $100 \times (\text{Numerator} \div \text{Denominator})$

Numerator: Number of persons aged 18 and over with self-reported type 2 diabetes and any of the following condition status:

1. Ever told has condition, still current and long-term
2. Ever told has condition, still current but not long-term
3. Ever told has condition, not current.

Numerator data elements: **Data Element / Data Set**

Person with self-reported type 2 diabetes

Data Source

Guide for use

Data source type: Survey

A new condition status was included in the 2017–18 survey:

6. Condition recurrent, but not known or not ever told, and not long term (new status in 2017–18 NHS).

This condition status was not used to determine type 2 diabetes prevalence to ensure comparability between surveys for assessing trends.

Disaggregation:

2011–12, 2014–15, 2017–18—Nationally, by:

- Age
- Sex
- remoteness (Australian Statistical Geography Standard (ASGS) Remoteness Structure)
- SEIFA IRSD quintiles.

2012–13—Nationally, by

- Indigenous status (Indigenous only) and sex.

Some disaggregation may result in numbers too small for publication.

ABS Australian Health Survey (AHS), 2011–13 excludes those living in *Very remote* areas and the indicator has only been reported for Major cities, Inner Regional and Outer regional/Remote across all surveys to enable comparisons across time.

Disaggregation data elements:

Data Element / Data Set

Person—area of usual residence, statistical area level 2 (SA2)
