

Indigenous-specific primary health care: PI21b- Proportion of Indigenous regular clients who have an absolute cardiovascular disease (CVD) risk assessment result within specified levels, December 2020

Identifying and definitional attributes

Metadata item type:	Indicator
Indicator type:	Indicator
Short name:	PI21b-Proportion of Indigenous regular clients who have an absolute cardiovascular disease (CVD) risk assessment result within specified levels, December 2020
METEOR identifier:	739470
Registration status:	<ul style="list-style-type: none">• Indigenous, Standard 09/08/2021
Description:	<p>Proportion of Indigenous regular clients, aged 35 to 74 and with no known history of cardiovascular disease (CVD), who had an absolute CVD risk assessment recorded within the previous 24 months and whose CVD risk was categorised as one of the following:</p> <ul style="list-style-type: none">• High (greater than 15% chance of a cardiovascular event in the next 5 years)• Moderate (10–15% chance of a cardiovascular event in the next 5 years)• Low (less than 10% chance of a cardiovascular event in the next 5 years).
Rationale:	<p>Early identification of persons at high CVD risk is important for effective prevention and management of the underlying disease. This is particularly the case for Indigenous Australians because of their poor CVD outcomes.</p> <p>Since a number of risk factors contribute to the development of CVD in an accumulative fashion, using two or more risk factors to assess risk has greater predictive power and is more accurate than if considered alone. Basing management decisions using multiple CVD risk factors therefore should improve health outcomes.</p>
Indicator set:	<p>Indigenous-specific primary health care national key performance indicators December 2020 Indigenous, Standard 14/07/2021</p>
Outcome area:	<p>Indigenous Australians achieve health outcomes comparable to the broader population Indigenous, Standard 21/07/2010</p>

Collection and usage attributes

Population group age from:	35 years
Population group age to:	74 years

Computation description: Proportion of [Indigenous regular clients](#), aged 35 to 74 and with no known history of cardiovascular disease (CVD), who had an absolute CVD risk assessment recorded within the previous 24 months and whose CVD risk was categorised as one of the following:

- High (greater than 15% chance of a cardiovascular event in the next 5 years)
- Moderate (10–15% chance of a cardiovascular event in the next 5 years)
- Low (less than 10% chance of a cardiovascular event in the next 5 years).

Presented as percentage.

Computation: (Numerator ÷ Denominator) x 100

Numerator: Calculation A: Number of Indigenous regular clients, aged 35 to 74 and with no known history of cardiovascular disease (CVD), who had an absolute CVD risk assessment recorded within the previous 24 months with risk assessed as high (greater than 15% over the next 5 years).

Calculation B: Number of Indigenous regular clients, aged 35 to 74 and with no known history of cardiovascular disease (CVD), who had an absolute CVD risk assessment recorded within the previous 24 months with risk assessed as moderate (10–15% over the next 5 years).

Calculation C: Number of Indigenous regular clients, aged 35 to 74 and with no known history of cardiovascular disease (CVD), who had an absolute CVD risk assessment recorded within the previous 24 months with risk assessed as low (less than 10% over the next 5 years).
