Indigenous-specific primary health care: Pl22b-Proportion of female Indigenous regular clients who have a cervical screening (HPV) test, June 2021

Identifying and definitional attributes

Metadata item type: Indicator Indicator type: Indicator

Short name: Pl22b-Proportion of female Indigenous regular clients who have a cervical

screening (HPV) test, June 2021

METEOR identifier: 747439

Registration status: Indigenous, Superseded 06/11/2022

Description: Proportion of female Indigenous regular clients aged 25-74 who have not had a

> hysterectomy and who had a cervical screening (human papillomavirus (HPV)) test within the previous 5 years where the test occurred on or after 1 December 2017.

Rationale: Cervical screenings are effective at detecting and treating cervical abnormalities

when they are still precancerous and have been found to significantly reduce the incidence and mortality of cervical cancer. Indigenous women experience higher cervical cancer incidence and mortality than non-Indigenous women. Increasing participation in cervical screening is important to reduce the number of women who

present with cervical cancer and ultimately die from the disease.

Indicator set: Indigenous-specific primary health care national key performance indicators June

2021

Indigenous, Superseded 06/11/2022

Collection and usage attributes

Population group age

from:

25 years.

Population group age to: 74 years.

Computation description: Proportion of female Indigenous regular clientsaged 25-74 who have not had

> a hysterectomy and who had a cervical screening (HPV) test within the previous 5 years where the test occurred on or after 1 December 2017.

Presented as a percentage.

Count is of women, not tests.

Cervical screening: an HPV test is a test that detects persistent HPV infection that causes the abnormal cell changes prior to the development of cervical cancer.

From 1 December 2017 the screening test for cervical cancer changed from the Pap test to a test for human papillomavirus (HPV), and the recommended screening age changed from 18–69 to 25–74. The HPV test is offered every 5 years instead of every 2 as it was with the Pap test.

Women are considered to have had appropriate screening if they have had a cervical screening (HPV) test within the previous 5 years where the test occurred

on or after 1 December 2017.

Include: HPV tests where the sample is either collected by a health practitioner or

self-collected.

Computation: (Numerator ÷ Denominator) x 100

Numerator: Number of female Indigenous regular clients aged 25-74 who have not had a

hysterectomy and who have had a cervical screening (HPV) test within the previous

5 years where the test occurred on or after 1 December 2017.

Numerator data elements: Data Element / Data Set Person—age, total years N[NN]
