# Indigenous-specific primary health care: Pl22a-Number of female Indigenous regular clients who have a cervical screening (HPV) test, June 2021

## Identifying and definitional attributes

Metadata item type: Indicator

Indicator type: Output measure

Short name: Pl22a-Number of female Indigenous regular clients who have a cervical screening

(HPV) test, June 2021

**METEOR** identifier: 747443

Registration status: Indigenous, Superseded 06/11/2022

**Description:** Number of female Indigenous regular clients aged 25-74 who have not had a

> hysterectomy and who had a cervical screening (human papillomavirus (HPV)) test within the previous 5 years where the test occurred on or after 1 December 2017.

Rationale: Cervical screenings are effective at detecting and treating cervical abnormalities

> when they are still precancerous and have been found to significantly reduce the incidence and mortality of cervical cancer. Indigenous women experience higher cervical cancer incidence and mortality than non-Indigenous women. Increasing participation in cervical screening is important to reduce the number of women who

present with cervical cancer and ultimately die from the disease.

Indicator set: Indigenous-specific primary health care national key performance indicators June

2021

Indigenous, Superseded 06/11/2022

# Collection and usage attributes

Population group age

from:

25 years.

Population group age to: 74 years.

Count of female Indigenous regular clientsaged 25-74 who have not had a Computation description:

> hysterectomy and who had a cervical screening (HPV) test within the previous 5 years where the test occurred on or after 1 December 2017.

Presented as a number.

Count is of women, not tests.

Cervical screening: an HPV test is a test that detects persistent HPV infection that causes the abnormal cell changes prior to the development of cervical cancer.

From 1 December 2017 the screening test for cervical cancer changed from the Pap test to a test for human papillomavirus (HPV), and the recommended screening age changed from 18–69 to 25–74. The HPV test is offered every 5 years instead of every 2 as it was with the Pap test.

Women are considered to have had appropriate screening if they have had a cervical screening (HPV) test within the previous 5 years where the test occurred

on or after 1 December 2017.

Include: HPV tests where the sample is either collected by a health practitioner or

self-collected.

Computation: Numerator only.

**Numerator:** Number of female Indigenous regular clients aged 25-74 who have not had a

hysterectomy and who had a cervical screening (HPV) test within the previous 5

years where the test occurred on or after 1 December 2017.

Numerator data elements: Data Element / Data SetPerson—age, total years N[NN]

**Data Source** 

Aboriginal and Torres Strait Islander specific primary health care national Key Performance Indicators (nKPI) data collection

NMDS / DSS

Indigenous-specific primary health care NBEDS June 2021

Guide for use

Aged 25-74 only.

#### Data Element / Data Set

Female—hysterectomy indicator, yes/no code N

**Data Source**
