Indigenous-specific primary health care: PI21a- Number of Indigenous regular clients who have an absolute cardiovascular disease (CVD) risk assessment result within a specified level, December 2022

Identifying and definitional attributes

Metadata item type:	Indicator
Indicator type:	Output measure
Short name:	PI21a-Number of Indigenous regular clients who have an absolute cardiovascular disease (CVD) risk assessment result within a specified level, December 2022
METEOR identifier:	779132
Registration status:	Indigenous , Superseded 18/12/2023
Description:	<p>Number of Indigenous regular clients, aged 35 to 74 and with no known history of cardiovascular disease (CVD), who had an absolute CVD risk assessment recorded within the previous 24 months and whose CVD risk was categorised as one of the following:</p> <ul style="list-style-type: none">• High (greater than 15% chance of a cardiovascular event in the next 5 years)• Moderate (10–15% chance of a cardiovascular event in the next 5 years)• Low (less than 10% chance of a cardiovascular event in the next 5 years).
Rationale:	<p>Early identification of persons at high CVD risk is important for effective prevention and management of the underlying disease. This is particularly the case for Indigenous Australians because of their poor CVD outcomes.</p> <p>Since a number of risk factors contribute to the development of CVD in a cumulative fashion, using two or more risk factors to assess risk has greater predictive power and is more accurate than considering each risk factor separately. Multiple risk factor analysis provides a better base on which to make management decisions to improve health outcomes.</p>
Indicator set:	Indigenous-specific primary health care national key performance indicators December 2022 Indigenous , Superseded 18/12/2023
Outcome area:	Indigenous Australians achieve health outcomes comparable to the broader population Indigenous , Superseded 25/02/2024

Collection and usage attributes

Population group age from:	35 years.
Population group age to:	74 years.
Computation description:	<p>Count of Indigenous regular clients, aged 35 to 74 and with no known history of cardiovascular disease (CVD), who had an absolute CVD risk assessment recorded within the previous 24 months and whose CVD risk was categorised as one of the following:</p> <ul style="list-style-type: none">• High (greater than 15% chance of a cardiovascular event in the next 5 years)• Moderate (10–15% chance of a cardiovascular event in the next 5 years)• Low (less than 10% chance of a cardiovascular event in the next 5 years). <p>Presented as a number.</p>

Computation:

Numerator only.

Numerator:

Calculation A: Number of Indigenous regular clients, aged 35 to 74 and with no known history of cardiovascular disease (CVD), who had an absolute CVD risk assessment recorded within the previous 24 months with risk assessed as high (greater than 15% over the next 5 years).

Calculation B: Number of Indigenous regular clients, aged 35 to 74 and with no known history of cardiovascular disease (CVD), who had an absolute CVD risk assessment recorded within the previous 24 months with risk assessed as moderate (10–15% over the next 5 years).

Calculation C: Number of Indigenous regular clients, aged 35 to 74 and with no known history of cardiovascular disease (CVD), who had an absolute CVD risk assessment recorded within the previous 24 months with risk assessed as low (less than 10% over the next 5 years).

Numerator data elements:**Data Element / Data Set**
